

JCheck Security Monitor V1.0 Update

Ravenswood IT are pleased to announce the release of version 1.0 of JCheck.

This release brings a number of minor bug fixes, performance enhancements and new features.

All current paid licences are valid with this new release.

v1.0 Changes

- Now sends email even in free version
- Multiple email addresses allowed for paid version
- Allows level of detail to be specified
- Improved concurrency handling
- Improved logging
- Better performance
- Minor bug fixes

This release is available from our download area

JCheck can be configured in many ways to eliminate false positives and minimise the effort required by site owners.

Alerts can be sent by Email or logged to a logfile for monitoring by other tools.

JCheck can be configured to run at periods as specified by the Administrator.

It can be used as standalone application running thru cron for the most effective protection, security and flexibility.

It can also be installed and used as a Joomla or Mambo module, whereby the module acts as a bridge to the JCheck application.

JCheck is available in two editions:

- The free version is fully functioning but has less flexibility in its configuration

- The very economical paid version allows the run interval to be set by the administrator. Email alerts can be configured and the link to our site can be turned off.

JCheck is available now from our download area.

Licences are available from our shop for a limited period at the very low price of £5 GBP per site.

N.B. JCheck is copyrighted commercial software. The core library is encrypted. The supplied Joomla/mambo module is Open Source and released under the LGPL licence.
